

R-134a Greenhouse Gas

Global Warming

R-134a refrigerant is a greenhouse gas. Leaking it into the atmosphere contributes to global warming.

The automotive A/C industry is working on a replacement for R-134a. We have joined the State of California in the following measures to ensure proper and responsible use.

- As of January 1, 2010, a \$10 California deposit and return program began.
- Consumers will return the small containers to receive the \$10 deposit back.
- Used containers will be recycled to recover the remaining refrigerant.
- It is illegal to destroy or discard used or unused small refrigerant containers under Section 95360 et. seq. of the California Cod of Regulations.
- Self-sealing valves will help to avoid accidental discharges.
- Better instructions and education resources will help you recharge you're A/C system properly.
